Energy performance of buildings - Ventilation for buildings

Part 2: Interpretation of the requirements in EN 16798-1 - Indoor environmental input parameters for design and assessment of energy performance of buildings addressing indoor air quality, thermal environment, lighting and acoustics (Module M1-6)

National foreword

This Published Document is the UK implementation of CEN/TR 16798-2:2019.

The UK participation in its preparation was entrusted to Technical Committee RHE/2, Ventilation for buildings, heating and hot water services.

A list of organizations represented on this committee can be obtained on request to its secretary.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

B.1	General.....	30
B.2	Default criteria for the thermal environment	30
B.2.1	Default categories for design of mechanically heated and cooled building....	30
B.2.2	Default acceptable indoor temperatures for design of buildings without mechanical cooling systems	33
B.2.3	Increased air velocity	34
B.2.4	Recommended indoor temperatures for energy calculations.....	34
B.3	Basis for the criteria for indoor air quality and ventilation rates.....	35
B.3.1	Default design ventilation air flow rates for non-residential buildings	35
B.3.2	Default design ventilation air flow rates for residential buildings.....	41
B.3.3	Recommended criteria for dimensioning of humidification and de-humidification.....	53
B.4	Example on how to define low and very low polluting buildings.....	53
B.5	Examples of criteria for lighting	57
B.6	Indoor system noise criteria of some spaces and buildings.....	58
B.6.1	Noise from continuous sources.....	58
B.6.2	Noise from service equipment in buildings.....	59
Annex C	(informative) Occupants schedules for energy calculations	61
Annex D	(informative) Long term evaluation of the general thermal comfort conditions	68
Annex E	(informative) Recommended criteria for acceptable deviations	71
E.1	Indoor Environmental Quality Category	71
E.2	Length of deviation.....	71
Annex F	(informative) Methodologies for subjective evaluations.....	75

Annex G (informative) Examples of classification and certification of the indoor environment	77
G.1 General	77
G.2 The design criteria used	77
G.3 Whole year computer simulations of the indoor environment and energy performance.....	77
G.4 Long term measurement of selected parameters for the indoor environment	78
G.5 Subjective responses from occupants	78
Annex H (informative) Recommended criteria for personalized systems	79
Annex I (informative) Recommended methods for substitute ventilation air by air cleaning.....	81
Annex J (informative) WHO criteria for health in the indoor environment	84
Bibliography.....	85

European foreword

This document (CEN/TR 16798-2:2019) has been prepared by Technical Committee CEN/TC 156 “Ventilation for buildings”, the secretariat of which is held by BSI.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN shall not be held responsible for identifying any or all such patent rights.

This document is part of the set of standards and accompanying Technical Reports on the energy performance of buildings and has been prepared under the Mandate M 480 given to CEN by the European Commission and the European Free Trade Association, see Bibliographical Reference [35]).

Directive 2010/31/EU recasting the Directive 2002/91/EC on energy performance of buildings (EPBD, [36]) promotes the improvement of the energy performance of buildings within the European Union, taking into account all types of energy uses (heating, lighting, cooling, air conditioning, ventilation) and outdoor climatic and local conditions, as well as indoor climate requirements and cost effectiveness (Article 1).

The directive requires Member States to adopt measures and tools to achieve the prudent and rational use of energy resources. In order to achieve those goals, the EPBD requires increasing energy efficiency and the enhanced use of renewable energies in both new and existing buildings. One tool for this is the application by Member States of minimum requirements on the energy performance of new buildings and for existing buildings that are subject to major renovation, as well as for minimum performance requirements for the building envelope if energy-relevant parts are replaced or retrofitted. Other tools are energy certification of buildings, inspection of boilers and air-conditioning systems.

The use of European standards increases the accessibility, transparency and objectivity of the energy performance assessment in the Member States facilitating the comparison of best practices and supporting the internal market for construction products. The use of EPB-standards for calculating energy performance, as well as for energy performance certification and the inspection of heating systems and boilers, ventilation and air-conditioning systems will reduce costs compared to developing different standards at national level.

The first mandate to CEN to develop a set of CEN EPBD standards (M/343, [34]), to support the first edition of the EPBD ([33]) resulted in the successful publication of all EPBD related CEN standards in 2007-2008.

The Mandate M/480 was issued to review the Mandate M/343 as the recast of the EPBD raised the need to revisit the standards and reformulate and add standards so that they become on the one hand unambiguous and compatible, and on the other hand a clear and explicit overview of the choices, boundary conditions and input data that need to be defined at national or regional level. Such national or regional choices remain necessary, due to differences in climate, culture and building tradition, policy and legal frameworks. Consequently, the set of CEN-EPBD standards published in 2007-2008 had to be improved and expanded on the basis of the recast of the EPBD.

The EPB standards are flexible enough to allow for necessary national and regional differentiation and facilitate Member States implementation and the setting of requirements by the Member States.

Further target groups are users of the voluntary common European Union certification scheme for the energy performance of non-residential buildings (EPBD art.11.9) and any other regional

(e.g. Pan European) parties wanting to motivate their assumptions by classifying the building energy performance for a dedicated building stock.

For the convenience of Standards users CEN/TC 156, together with responsible Working Group Conveners, have prepared a simple table below relating, where appropriate, the relationship between the 'EPBD' and 'recast EPBD' standard numbers prepared by Technical Committee CEN/TC 156 "Ventilation for buildings".

Introduction

This document is a guide to EN 16798-1 and can help the user in application of the standard and give additional background information. Besides this document describes and recommends additional topics related to the evaluation of the indoor environmental quality and new possibilities to improve the indoor environmental quality and reduce energy use of buildings like personalized systems, air cleaning technologies, consideration of adapted persons, etc.

This document explains how design criteria can be established and used for dimensioning of systems. It explains how to establish and define the main parameters to be used as input for building energy calculation and long term evaluation of the indoor environment. This document also describes how gas phase air cleaning in the future can improve the indoor air quality and partly substitute for outside air. Finally it will identify parameters to be used for monitoring and displaying of the indoor environment. Different categories of criteria can be used depending on type of building, type of occupants, type of climate and national differences. The report explains how these different categories of indoor environment can be individually selected as national criteria, be used in project agreement for design criteria and for displaying the yearly building performance in relation to indoor environmental quality. The designer can also define other categories using the principles from EN 16798-1 and this document.

1 Scope

This document deals with the indoor environmental parameters for thermal environment, indoor air quality, lighting and acoustic. The document explains how to use EN 16798-1 for specifying indoor environmental input parameters for building system design and energy performance calculations. The document specifies methods for long term evaluation of the indoor environment obtained as a result of calculations or measurements. The document specifies criteria for measurements which can be used if required to measure compliance by inspection. The Document identifies parameters to be used by monitoring and displaying the indoor environment in existing buildings. This document is applicable where the criteria for indoor environment are set by human occupancy and where the production or process does not have a major impact on indoor environment. The document explains how different categories of criteria for the indoor environment can be used.
