Part 1: Metadata concepts

## National foreword

This Published Document is the UK implementation of ISO/IEC TR 19583-1:2019.

The UK participation in its preparation was entrusted to Technical Committee IST/40, Data management and interchange.

A list of organizations represented on this committee can be obtained on request to its secretary.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

## Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)) or the IEC list of patent declarations received (see <http://patents.iec.ch>).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html).

This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 32, *Data management and interchange*.

A list of all parts in the ISO/IEC 19583 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at [www.iso.org/members.html](http://www.iso.org/members.html).

## Introduction

This document describes the concept of metadata, particularly in respect of its use within the data management speciality in information technology.

The ISO/IEC 11179<sup>[2]</sup> and ISO/IEC 19763<sup>[4]</sup> series describe the structure for registering information about metadata that is used and/or held elsewhere.

The ISO/IEC 11179 series defines metadata as “data that defines and describes other data”. There are, however, many other definitions of metadata that are used more generally, for example, the US National Information Standards Organization (NISO) defines metadata as “structured information which describes, explains, locates, or otherwise makes it easier to retrieve, use, or manage an information resource”.

Metadata is, therefore, just data, but data which has the specific purpose of defining or describing other data. Metadata is normally used within a particular context, which is the set of circumstances, purposes or perspectives within which any particular item of data is used as metadata. Metadata can, therefore, be considered to be data about data within some context.

The definitions above, by themselves, do not say how metadata arises, where it comes from, how it is used, or how it is managed (although the ISO/IEC 11179 series describes the facilities for registering and managing structured metadata). For those reasons, this document has been developed to provide a broader view of metadata and the associated concept of the metamodel.

These concepts of metadata and metamodels are important when trying to understand exactly what is being registered within the registries whose structure is specified in the ISO/IEC 11179 and ISO/IEC 19763 series.

# Information technology — Concepts and usage of metadata —

## Part 1: Metadata concepts

### 1 Scope

This document describes the basic concept of metadata, and its relationship to both data and metamodels.

### 2 Normative references

There are no normative references in this document.

### 3 Terms and definitions

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <http://www.electropedia.org/>

### 4 Introduction to metadata

Metadata is defined as “data that defines and describes other data”. This is a very broad definition of metadata leaving room for confusion. It is often said that one person’s metadata is another person’s data. Whether any piece of data is seen as metadata or just data depends on the context. These contexts can be classified into three distinct groups:

- structural metadata: the metadata used by those responsible for the management of data in information systems to describe the ‘containers’ of data, for example, the tables and columns in a database managed using the SQL database language;
- descriptive metadata: the metadata used for the discovery and identification of content, such as by librarians, and the metadata that helps to further describe other data, such as metadata that a scientist has observed about continuous or systematically produced data;
- administrative metadata: the metadata associated with data values, such as metadata describing when and who created the data, who can edit and manage the data, and any other information about the data that is deemed useful, including metadata that describes multimedia data.

The focus of this document is the first of these groups: the structural metadata used within data management. The use of descriptive metadata is explained in [Annex A](#) and the use of administrative metadata is explained in [Annex B](#).

For any data to be useful or shareable the meaning of the data (the semantics), the data type and format of the data (the syntax) and the relationship of the data to other data (the structure) must be known. All of this information about data is metadata.

Metadata is independent of the systems that produce the data. Metadata is usually defined before systems are built, either as part of the systems development of an individual system or as part of an enterprise-wide data management initiative. However, metadata can be recorded after the data has
